

SE08XX-TC Series Throttle Controller

Operating Instructions

Press to cycle between modes:

- EC:** Economy. Nine Levels
- OE:** Original Equipment. One Level (Stock)
- CF:** Comfort. Nine Levels
- SP:** Sport. Nine Levels
- LU:** Ludicrous. Nine Levels

Press to decrease/increase levels within each mode.

EC: Response is under stock pedal curve. Non-linear, with very low rate of change of throttle opening under 50% pedal input and very high rate of change over 50% pedal input. Helps in accelerating slowly for **economy** or reduce tip-in sensitivity.

OE: Bypasses pedal signal to provide same response as **original equipment** stock pedal curve.

CF: Slightly above stock response curve, energetic yet **comfortable**.

SP: Above stock curve as to approximate near linear response, best linearity is achieved at level 5 (SP.5) when used with SE throttle bodies. For **sport/spirited** driving.

LU: Well above stock curve, non-linear, with very high rate of change of throttle opening under 50% pedal input and very low rate of change over 50% pedal input. Yes, it is **ludicrous**, that's why.
